

Aim: make a mobile presentation of your skills and projects you have worked on.

Description:

For my project I will distribute the information I want to communicate in three parts, to properly illustrate the structure of the information in my application, I would highlight the three different parties in the "Wireframe" accompanying this document.

First part :

This first part is entitled 'Présentation' this will be the first thing that the user sees when starting my app, this part of my application will forward my presentation which will include my technical skills, my training, and my personal information.

Second part:

This second part of my app will be called "Work" and will focus on the various projects that I realized during the training and will have a screenshot with a brief explanation of the project, technologies, and features.

Third part:

The third and last part of my app will be called 'contact' it will contain all the links to my various pages on social networks and a contact form to send me a message which will be passed on to me by E-mail.

Navigation: The navigation will be normally made through the native functionality of the phone, but will also have a menu setting at the top right of the screen that will redirect the user to the different parts of the information offered through the application.

Technology used: Angular 2, Ionic Framework, Apache Cordova.
